[Canada Nickel Company \(TSX.V: CNC\) – Case Study – 2022 Update – Insidexploration](#)

Nickel is quickly becoming a hot topic among investors these days as the electric vehicle market is poised to see an increase in demand over the next several years. Mainly because we are becoming more conscientious to the effects of global warming and the carbon footprint we are leaving on the planet. As such, we are now seeing influential people like Elon Musk calling for more production of nickel sulphate to supply the electric vehicle market, but more importantly, in an environmentally friendly way. Currently most of the world's nickel supply comes from places like New Caledonia, the Philippines and Indonesia, which rely on coal-powered electricity, which is counter intuitive to the concept of greener technologies. This is where an operation like the Crawford Nickel-Cobalt project in Canada could become a major player in the nickel space as they intend to vastly reduce their carbon footprint to the point of NetZero through a range of innovative initiatives.
